### Lyme Ab Interpretation

SDL

IgM and IgG-class antibodies to the *Borrelia* (*Borrelia*) species causing Lyme disease were detected, suggesting infection in the recent or remote past. Antibodies may remain detectable for months to years following resolution of infection. Results should not be used to monitor or establish adequate response to therapy. Response to therapy is confirmed through resolution of clinical symptoms; additional laboratory testing should not be performed. If both first and second tier tests are equivocal consider repeat testing in 7–14 days if clinically warranted. Interpretation assumes first tier *Borrelia* antibody test was performed and resulted as positive or equivocal.
