EBV Ab Profile, S

EBV VCA IgM, S

 Equivocal
Abn

SDL
Reference Value
Negative

Interpretation

SDL

Recommend follow-up testing in 10–14 days if clinically indicated.

ADDITIONAL INFORMATION

Over 90% of the adult population will have been infected with EBV sometime in the past and therefore, will be positive for IgG against the viral capsid antigen (VCA) and the EBV Nuclear Antigen (EBNA). Antibodies to EBNA develop 6–8 weeks after primary infection and remain present for life. Presence of IgM against VCA indicates recent infection with EBV.
