Chromogranin A, S
50 ng/mL
1 SDL
**Reference Value
<93**

In some immunoassays, the presence of unusually high concentrations of analyte may result in a high-dose "hook" effect. This may result in a lower or even normal measured analyte concentration. If the reported result is inconsistent with the clinical presentation, the laboratory should be alerted for troubleshooting. For diagnostic purposes, these immunoassay results should always be assessed in conjunction with the patients medical history, clinical examination and other findings.

The testing method is a homogeneous time-resolved immunofluorescent assay manufactured by Thermo Scientific and performed on the BRAHMS Kryptor Compact Plus.

Values obtained with different assay methods or kits may be different and cannot be used interchangeably.

Test results cannot be interpreted as absolute evidence for the presence or absence of malignant disease.
