

Nuclear Magnetic Resonance Lipoprotein Profile, Serum

#### **Overview**

#### **Useful For**

Assessment and management of a patient's risk for atherosclerotic cardiovascular disease

Identifying residual risk that may be present in some patients on cholesterol targeting treatment

#### **Method Name**

Nuclear Magnetic Resonance (NMR)

#### **NY State Available**

Yes

## Specimen

### Specimen Type

Serum Red

## Specimen Required

#### **Patient Preparation:**

- 1. **Fasting overnight** (12-14 hours) **is required**. On night before examination, evening meal should be eaten before 6 p.m. and should contain no fatty foods.
- 2. Patient must not consume any alcohol for 24 hours before the specimen is collected.

**Collection Container/Tube:** Red top (serum gel/SST are **not acceptable**)

Submission Container/Tube: Plastic vial

**Specimen Volume:** 1.5 mL **Collection Instructions:** 

- 1. Allow isopropyl alcohol (from phlebotomy site prep) to dry thoroughly before venipuncture.
- 2. Centrifuge and aliquot serum into a plastic vial.

#### **Forms**

If not ordering electronically, complete, print, and send a <u>Cardiovascular Test Request Form</u> (T724) with the specimen.

### Specimen Minimum Volume

1 mL

#### **Reject Due To**

Gross	Reject
hemolysis	

Nuclear Magnetic Resonance Lipoprotein Profile, Serum

Gross lipemia	Reject
Gross icterus	Reject

# **Specimen Stability Information**

Specimen Type	Temperature	Time	Special Container
Serum Red	Ambient	8 hours	
	Refrigerated (preferred)	7 days	
	Frozen	14 days	

## Clinical & Interpretive

#### **Clinical Information**

Low-density lipoprotein particle (LDL-P) concentration is positively associated with increased risk of atherosclerotic cardiovascular disease (ASCVD). LDL-P is heterogeneous and contains many lipids and proteins, including phospholipids, triglycerides, and cholesterol. LDL cholesterol is a surrogate biomarker of LDL-P.

LDL cholesterol is the historical measure of atherogenic lipid burden. There is a large variance in the relative amount of cholesterol carried by each LDL-P. Consequently, subjects with similar LDL cholesterol values can have markedly different serum concentrations of LDL-P. Multiple studies have shown that serum concentrations of LDL-P more accurately reflect actual risk of ASCVD when LDL cholesterol values are discrepant.

High-density lipoprotein particle (HDL-P) concentration is inversely associated with risk of ASCVD. HDL cholesterol is also inversely associated with ASCVD, since it is a surrogate marker for HDL-P. Like other lipoproteins, HDL-P is heterogeneous, and particles contain highly variable proportions of proteins and lipids, including phospholipids, sphingolipids, and cholesterol.

Several large clinical studies have shown that HDL-P is more significantly associated with ASCVD risk than HDL cholesterol. Furthermore, HDL-P remains significantly associated with ASCVD even among subjects taking cholesterol-lowering medications. HDL-P more accurately reflects actual risk of ASCVD when HDL cholesterol values are discrepant.

#### **Reference Values**

> or =18 years:

LDL Particles:

Desirable: <1,000 nmol/L

Above Desirable: 1,000-1,299 nmol/L Borderline high: 1,300-1,599 nmol/L

High: 1,600-2,000 nmol/L Very high: > or =2,000 nmol/L

Nuclear Magnetic Resonance Lipoprotein Profile, Serum

**HDL Particles:** 

Male: >30 mcmol/L Female: >35 mcmol/L

LDL Cholesterol (NMR): Desirable: <100 mg/dL

Above Desirable: 100-129 mg/dL Borderline high: 130-159 mg/dL

High: 160-189 mg/dL

Very high: > or =190 mg/dL

Reference values have not been established for patients younger than 18 years of age.

#### Interpretation

Elevated concentrations of low-density lipoprotein particle (LDL-P) are associated with increased risk of atherosclerotic cardiovascular disease.

LDL-P is a more accurate indicator of risk when LDL cholesterol is discordantly low.

Lower concentrations of high-density lipoprotein particle are associated with increased risk of atherosclerotic cardiovascular disease.

#### **Cautions**

Failure to follow specimen collection requirements may prevent measurable results.

Nuclear Magnetic Resonance Lipoprotein Profile, Serum

doi:10.1161/CIRCULATIONAHA.116.025678

#### **Performance**

#### **Method Description**

Lipoprotein particles are quantified in serum by nuclear magnetic resonance (NMR). The deconvoluting algorithm used is the AXINON Mayo LP Profiler software. (Instruction manual: AXINON System User Manual Version 1.3.2, 03/2018)

#### **PDF Report**

No

## Day(s) Performed

Tuesday, Friday

#### Report Available

2 to 7 days

#### **Specimen Retention Time**

7 days

# **Performing Laboratory Location**

Rochester

#### **Fees & Codes**

#### **Fees**

- Authorized users can sign in to <u>Test Prices</u> for detailed fee information.
- Clients without access to Test Prices can contact <u>Customer Service</u> 24 hours a day, seven days a week.
- Prospective clients should contact their account representative. For assistance, contact <u>Customer Service</u>.

#### **Test Classification**

This test was developed and its performance characteristics determined by Mayo Clinic in a manner consistent with CLIA requirements. It has not been cleared or approved by the US Food and Drug Administration.
