

Seasonal Inhalants Allergen Profile, Serum

# Overview

### **Useful For**

Establishing a diagnosis of an allergy to seasonal inhalants

Defining the allergen responsible for eliciting signs and symptoms

Identifying allergens:

-Responsible for allergic response and/or anaphylactic episode

-To confirm sensitization prior to beginning immunotherapy

-To investigate the specificity of allergic reactions to insect venom allergens, drugs, or chemical allergens

#### **Profile Information**

Test Id	Reporting Name	Available Separately	Always Performed
RYEG	Rye Grass, IgE	Yes	Yes
JUNE	June Grass, IgE	Yes	Yes
SRW	Short Ragweed, IgE	Yes	Yes
EGPL	English Plantain, IgE	Yes	Yes
LAMQ	Lambs Quarter, IgE	Yes	Yes
BXMPL	Box Eld/Maple, S, IgE	Yes	Yes
ОАК	Oak, IgE	Yes	Yes
ELM	Elm, IgE	Yes	Yes
TIMG	Timothy Grass, IgE	Yes	Yes
BIR	Silver Birch, IgE	Yes	Yes

#### **Special Instructions**

<u>Allergens - Immunoglobulin E (IgE) Antibodies</u>

#### Method Name

Fluorescence Enzyme Immunoassay (FEIA)

## NY State Available

Yes

### Specimen

Specimen Type

Serum

Seasonal Inhalants Allergen Profile, Serum

#### **Ordering Guidance**

For a listing of allergens available for testing, see Allergens - Immunoglobulin E (IgE) Antibodies

Specimen Required Collection Container/Tube: Preferred: Serum gel Acceptable: Red top Submission Container/Tube: Plastic vial Specimen Volume: 1 mL Collection Instructions: Centrifuge and aliquot serum into a plastic vial.

#### Forms

If not ordering electronically, complete, print, and send an <u>Allergen Test Request</u> (T236) with the specimen.

Specimen Minimum Volume

0.75 mL

#### Reject Due To

Gross	ОК
hemolysis	
Gross lipemia	ОК

#### **Specimen Stability Information**

Specimen Type	Temperature	Time	Special Container
Serum	Refrigerated (preferred)	14 days	
	Frozen	90 days	

### Clinical & Interpretive

#### **Clinical Information**

Clinical manifestations of immediate hypersensitivity (allergic) diseases are caused by the release of proinflammatory mediators (histamine, leukotrienes, and prostaglandins) from IgE-sensitized effector cells (mast cells and basophils) when cell-bound IgE antibodies interact with allergen.

In vitro serum testing for IgE antibodies provides an indication of the immune response to allergens that may be associated with allergic disease.

The allergens chosen for testing often depend upon the age of the patient, history of allergen exposure, season of the year, and clinical manifestations. In individuals predisposed to develop allergic disease, the sequence of sensitization and clinical manifestations proceed as follows: eczema and respiratory disease (rhinitis and bronchospasm) in infants and children younger than 5 years of age due to food sensitivity (milk, egg, soy, and wheat proteins), followed by respiratory disease (rhinitis and asthma) in older children and adults due to sensitivity to inhalant allergens (dust mites,

Seasonal Inhalants Allergen Profile, Serum

mold, and pollen inhalants).

## **Reference Values**

Class	lgE kU/L	Interpretation
0	<0.10	Negative
0/1	0.10-0.34	Borderline/equivocal
1	0.35-0.69	Equivocal
2	0.70-3.49	Positive
3	3.50-17.4	Positive
4	17.5-49.9	Strongly positive
5	50.0-99.9	Strongly positive
6	> or =100	Strongly positive

Reference values apply to all ages.

### Interpretation

Detection of IgE antibodies in serum (class 1 or greater) indicates an increased likelihood of allergic disease as opposed to other etiologies and defines the allergens that may be responsible for eliciting signs and symptoms.

The level of IgE antibodies in serum varies directly with the concentration of IgE antibodies expressed as a class score or kU/L.

#### Cautions

Testing for IgE antibodies is not useful in patients previously treated with immunotherapy to determine if residual clinical sensitivity exists, or in patients in whom the medical management does not depend upon identification of allergen specificity.

Some individuals with clinically insignificant sensitivity to allergens may have measurable levels of IgE antibodies in serum, and test results must be interpreted in the clinical context.

False-positive results for IgE antibodies may occur in patients with markedly elevated serum IgE (>2500 kU/L) due to nonspecific binding to allergen solid phases.

# Performance

### **Method Description**

Specific IgE from the patient's serum reacts with the allergen of interest, which is covalently coupled to an ImmunoCAP. After washing away nonspecific IgE, enzyme-labeled anti-IgE antibody is added to form a complex. After incubation, unbound anti-IgE is washed away, and the bound complex incubated with a developing agent. After stopping the reaction, the fluorescence of the eluate is measured. Fluorescence is proportional to the amount of specific IgE present

## Seasonal Inhalants Allergen Profile, Serum

in the patient's sample (ie, the higher the fluorescence value, the more IgE antibody is present).(Package insert: ImmunoCAP System Specific IgE FEIA. Phadia; Rev 06/2020)

#### PDF Report

No

# Day(s) Performed

Monday through Friday

Report Available

Same day/1 to 3 days

# Specimen Retention Time 14 days

Performing Laboratory Location

Rochester

# Fees & Codes

#### Fees

- Authorized users can sign in to <u>Test Prices</u> for detailed fee information.
- Clients without access to Test Prices can contact <u>Customer Service</u> 24 hours a day, seven days a week.
- Prospective clients should contact their account representative. For assistance, contact <u>Customer Service</u>.

### **Test Classification**

This test has been cleared, approved, or is exempt by the US Food and Drug Administration and is used per manufacturer's instructions. Performance characteristics were verified by Mayo Clinic in a manner consistent with CLIA requirements.

### **CPT Code Information**

86003 x 10
