

Oligoclonal Banding, Spinal Fluid

# Overview

#### **Useful For**

Diagnosis of multiple sclerosis; especially useful in patients with equivocal clinical presentation and radiological findings

#### **Method Name**

Only orderable as part of a profile. For more information, see:

- -OLIG / Oligoclonal Banding, Serum and Spinal Fluid
- -MSP3 / Multiple Sclerosis (MS) Profile, Serum and Spinal Fluid

Isoelectric Focusing (IEF) with IgG Immunoblot Detection

#### **NY State Available**

Yes

# Specimen

# **Specimen Type**

**CSF** 

#### **Specimen Required**

Only orderable as part of a profile. For more information, see:

- -OLIG / Oligoclonal Banding, Serum and Spinal Fluid
- -MSP3 / Multiple Sclerosis (MS) Profile, Serum and Spinal Fluid

Specimen Type: Spinal fluid Container/Tube: Sterile vial Specimen Volume: 0.5 mL

**Collection Instructions:** Label specimen as spinal fluid.

#### **Specimen Minimum Volume**

See Specimen Required

#### Reject Due To

All specimens will be evaluated at Mayo Clinic Laboratories for test suitability.

#### **Specimen Stability Information**

Specimen Type	Temperature	Time	Special Container
CSF	Ambient	14 days	

Oligoclonal Banding, Spinal Fluid

Refrigerated (preferred)	14 days	
Frozen	14 days	

# Clinical & Interpretive

#### **Clinical Information**

The diagnosis of multiple sclerosis (MS) is dependent on clinical, radiological, and laboratory findings. The detection of increased intrathecal immunoglobulin (Ig) synthesis is the basis for current diagnostic laboratory tests for MS. These tests include the cerebrospinal fluid (CSF) IgG index and CSF oligoclonal band (OCB) detection. Abnormal CSF IgG indexes and OCB patterns have been reported in 70% to 80% of MS patients.

Increased intrathecal Ig synthesis may occur in other inflammatory CSF diseases and, therefore, this assay is not specific for MS.

#### **Reference Values**

Only orderable as part of a profile. For more information, see:

- -OLIG / Oligoclonal Banding, Serum and Spinal Fluid
- -MSP3 / Multiple Sclerosis (MS) Profile, Serum and Spinal Fluid

Cerebrospinal fluid Oligoclonal Bands Interpretation: <2 bands

#### Interpretation

When the oligoclonal band assay detects 2 or more unique IgG bands in the cerebrospinal fluid (CSF), the result is positive.

CSF is used in the diagnosis of multiple sclerosis (MS) by identifying increased intrathecal IgG synthesis qualitatively (oligoclonal bands). The presence of 2 or more unique CSF oligoclonal bands was reintroduced as one of the diagnostic criteria for MS in the 2017 revised McDonald criteria. These findings however, are not specific for MS as CSF-specific IgG synthesis may also be found in patients with other neurologic diseases including infectious, inflammatory, cerebrovascular, and paraneoplastic disorders. Clinical correlation recommended.

## **Cautions**

These tests are not specific for multiple sclerosis.

bands in multiple sclerosis. Neurology. 2019 April 09;2019:92

#### **Performance**

#### **Method Description**

The oligoclonal band (OCB) assay requires paired cerebrospinal fluid (CSF) and serum samples. Unconcentrated CSF and diluted serum are electrophoresed by isoelectric focusing. The separated immunoglobulins (Ig) are visualized by an IgG immunoblot, and OCBs that are present in the CSF and not in the serum are reported. The assay uses reagents from Helena Laboratories. (Keir G, Luxton RW, Thompson EJ: Isoelectric focusing of cerebrospinal fluid immunoglobulins G: an annotated update. Ann Clin Biochem. 1990;27:436-443; Hortin GL: Amino Acids, Peptides, and Proteins.
