_____

## Overview

### Useful For
Evaluating the risk of major adverse cardiovascular events within the next 1 to 5 years

### Highlights
Plasma ceramides predict risk of myocardial infarction, coronary revascularization, acute coronary syndrome hospitalization and mortality within 5 years.

Risk conferred by plasma ceramides is independent of low-density lipoprotein (LDL) cholesterol, C-reactive protein, LDL particles, and lipoprotein-associated phospholipase A2.

Plasma ceramides can be lowered by diet, exercise, simvastatin, rosuvastatin, and proprotein convertase subtilisin/kexin type 9 (PCSK9) inhibitors.

### Method Name
Liquid Chromatography Tandem Mass Spectrometry (LC-MS/MS)

### NY State Available
Yes

## Specimen

### Specimen Type
Plasma EDTA

### Specimen Required
**Patient Preparation:** Patients should not be receiving Intralipid because it may cause false elevations in measured ceramides.
**Collection Container/Tube:** Lavender top (EDTA)
**Submission Container/Tube:** Plastic vial
**Specimen Volume:** 1 mL
**Collection Instructions:** Centrifuge, aliquot at least 1 mL of plasma into a plastic vial and freeze within 8 hours.

### Forms
If not ordering electronically, complete, print, and send a [Cardiovascular Test Request Form](#) (T724) with the specimen.

### Specimen Minimum Volume
0.5 mL

### Reject Due To

_____

_____

| Gross hemolysis | Reject |
|---|---|
| Gross lipemia | OK |
| Gross icterus | OK |

## Specimen Stability Information

| Specimen Type | Temperature | Time | Special Container |
|---|---|---|---|
| Plasma EDTA | Ambient | 8 hours | |
| | Refrigerated | 24 hours | |
| | Frozen (preferred) | 30 days | |

## Clinical & Interpretive

### Clinical Information

MI-Heart Ceramides is a blood test that measures risk for adverse cardiovascular events and quantifies plasma ceramides. Plasma ceramides are predictors of adverse cardiovascular events resulting from unstable atherosclerotic plaque. Ceramides are complex lipids that play a central role in cell membrane integrity, cellular stress response, inflammatory signaling, and apoptosis. Synthesis of ceramides from saturated fats and sphingosine occurs in all tissues. Metabolic dysfunction and dyslipidemia results in accumulation of ceramides in tissues not suited for lipid storage. Elevated concentrations of circulating ceramides are associated with atherosclerotic plaque formation, ischemic heart disease, myocardial infarction, hypertension, stroke, type 2 diabetes mellitus, insulin resistance, and obesity.

Three specific ceramides have been identified as highly linked to cardiovascular disease and insulin resistance: N-palmitoyl-sphingosine (Cer16:0), N-stearoyl-sphingosine (Cer18:0), and N-nervonoyl-sphingosine(Cer24:1). A fourth ceramide, N-lignoceroyl-sphingosine (Cer24:0), is highly abundant in all individuals and is useful as a normalization factor for intra-individual variability of ceramide concentrations. Individuals with elevated plasma ceramides are at higher risk of major adverse cardiovascular events even after adjusting for age, gender, smoking status, and serum biomarkers such as low-density lipoprotein and high-density lipoprotein cholesterol, C-reactive protein and lipoprotein-associated phospholipase A2. Ceramide concentrations are reduced by current cardiovascular therapies including diet, exercise, statins, and proprotein convertase subtilisin/kexin type inhibitors.

### Reference Values

MI-Heart Ceramide Risk Score:

0-2 Lower risk

3-6 Moderate risk

7-9 Increased risk

10-12 Higher risk

Ceramide (16:0): 0.19-0.36 mcmol/L

Ceramide (18:0): 0.05-0.14 mcmol/L

Ceramide (24:1): 0.65-1.65 mcmol/L

Ceramide (16:0)/(24:0): <0.11

Ceramide (18:0)/(24:0): <0.05

Ceramide (24:1)/(24:0): <0.45

_____

_____

Reference values have not been established for patients who are less than 18 years of age.

**Note:** Ceramide (24:0) alone has not been independently associated with disease and will not be reported.

## Interpretation

Elevated plasma ceramides are associated with increased risk of myocardial infarction, acute coronary syndromes, and mortality within 1 to 5 years.

| Ceramide Score | Relative Risk | Risk Category |
|---|---|---|
| 0-2 | 1.0 | Lower |
| 3-6 | 1.5 | Moderate |
| 7-9 | 2.2 | Increased |
| 10-12 | 3.5 | Higher |

Score is based on trial data including >4000 subjects.

## Cautions

No significant cautionary statements.

## Performance

## Method Description

_____

___

Ceramides are separated and quantified by liquid chromatography tandem mass spectrometry (LC-MS/MS).(Unpublished Mayo method)

## PDF Report
No

## Day(s) Performed
Monday, Wednesday, Friday

## Report Available
2 to 7 days

## Specimen Retention Time
14 days

## Performing Laboratory Location
Rochester

## Fees & Codes

### Fees
- Authorized users can sign in to Test Prices for detailed fee information.
- Clients without access to Test Prices can contact Customer Service 24 hours a day, seven days a week.
- Prospective clients should contact their account representative. For assistance, contact Customer Service.

### Test Classification
This test was developed and its performance characteristics determined by Mayo Clinic in a manner consistent with CLIA requirements. It has not been cleared or approved by the US Food and Drug Administration.

### CPT Code Information
0119U
