

Overview

Useful For

Identifying the presence and type of crystals in body fluid

Method Name

Compensated Polarized Light Microscopy

NY State Available

Yes

Specimen

Specimen Type

Body Fluid

Specimen Required

Specimen Required

Specimen Type: Synovial Fluid, Prosthetic Joint Fluid

Container/Tube: Lavender top (EDTA)

Acceptable: Green top (heparin)

Specimen Volume: 2 mL

Specimen Type: Bile Fluid

Container/Tube: Red top

Specimen Volume: 2 mL

Specimen Type: Bronchoalveolar Lavage (BAL)

Container/Tube: Body fluid container

Specimen Volume: 2 mL

Specimen Type: Pleural Fluid, Peritoneal Fluid, Pericardial fluid

Container/Tube:

Preferred: Body fluid container

Acceptable: Lavender top (EDTA) or Green top (heparin)

Specimen Volume: 2 mL

Specimen Minimum Volume

0.5 mL

Reject Due To

All specimens will be evaluated at Mayo Clinic Laboratories for test suitability.

Specimen Stability Information

Specimen Type	Temperature	Time	Special Container
Body Fluid	Refrigerated (preferred)		
	Ambient	24 hours	
	Frozen		

Clinical & Interpretive

Clinical Information

Birefringent crystals are found in the synovial fluid of more than 90% of patients with acutely inflamed joints. Monosodium urate crystals are seen in gouty fluids and calcium pyrophosphate crystals are seen in chondrocalcinosis. The urates are usually needle-shaped, and the calcium crystals are often rhomboidal. Cholesterol crystals may also be observed.

Reference Values

None seen

If present, crystals are identified.

Interpretation

Positive identification of crystals provides a definitive diagnosis for joint disease.

Cautions

Powdered anticoagulants such as oxalate are themselves crystalline or may cause crystals to form; their use may cause false-positive results or mask the presence of synovial fluid crystals definitive for the disease.

Clinical Reference

Performance

Method Description

The specimen is examined with a polarizing microscope with and without a first-order red compensator. Cholesterol crystals appear as bright, square or rectangular plates. Pyrophosphate crystals, rhomboidal, are weakly birefringent. Urate crystals are mainly needle-shaped and strongly doubly refractile; they may be found within leukocytes.(Hussong JW, Sorensen E, Perkins SL, et al: Laboratory methods. In: Hussong JW, Kjeldsberg CR, eds. Kjeldsberg's Body Fluid Analysis. ASCP; 2015:chap 2)

PDF Report

No

Day(s) Performed

Monday through Sunday

Report Available

1 day

Specimen Retention Time

1 week

Performing Laboratory Location

Rochester
