

Renal Pathology Consultation, Wet Tissue

Test ID: RPCWT

Explanation: Specimen collection for RPCWT will now only require two solutions: Formalin for Light Microscopy and Electron Microscopy; and Zeus/Michel's for Immunofluorescence. The Gluta/Trumps solution is no longer required for Electron Microscopy.

While the kit is changing to only two specimen containers/fixatives, three biopsy cores are still recommended (one for Zeus/Michel's and two for formalin).

The Renal Biopsy Kit (T231) will change to only providing two solutions. Current supply kits with three solutions can still be used up to their expiration date.
